Activity_Course 2 TikTok project lab

October 29, 2023

1 TikTok Project

Course 2 - Get Started with Python

Welcome to the TikTok Project!

You have just started as a data professional at TikTok.

The team is still in the early stages of the project. You have received notice that TikTok's leadership team has approved the project proposal. To gain clear insights to prepare for a claims classification model, TikTok's provided data must be examined to begin the process of exploratory data analysis (EDA).

A notebook was structured and prepared to help you in this project. Please complete the following questions.

2 Course 2 End-of-course project: Inspect and analyze data

In this activity, you will examine data provided and prepare it for analysis.

The purpose of this project is to investigate and understand the data provided. This activity will:

1. Acquaint you with the data
2. Compile summary information about the data
3. Begin the process of EDA and reveal insights contained in the data
4. Prepare you for more in-depth EDA, hypothesis testing, and statistical analysis

The goal is to construct a dataframe in Python, perform a cursory inspection of the provided dataset, and inform TikTok data team members of your findings. *This activity has three parts:*

Part 1: Understand the situation * How can you best prepare to understand and organize the provided TikTok information?

Part 2: Understand the data

- Create a pandas dataframe for data learning and future exploratory data analysis (EDA) and statistical activities
- Compile summary information about the data to inform next steps

Part 3: Understand the variables

- Use insights from your examination of the summary data to guide deeper investigation into variables

To complete the activity, follow the instructions and answer the questions below. Then, you will us your responses to these questions and the questions included in the Course 2 PACE Strategy Document to create an executive summary.

Be sure to complete this activity before moving on to Course 3. You can assess your work by comparing the results to a completed exemplar after completing the end-of-course project.

3 Identify data types and compile summary information

Throughout these project notebooks, you'll see references to the problem-solving framework PACE. The following notebook components are labeled with the respective PACE stage: Plan, Analyze, Construct, and Execute.

4 PACE stages

- `[Plan](#scrollTo=psz51YkZVwtN&line=3&uniqifier=1)`
- `[Analyze](#scrollTo=mA7Mz_SnI8km&line=4&uniqifier=1)`
- `[Construct](#scrollTo=Lca9c8XON8lc&line=2&uniqifier=1)`
- `[Execute](#scrollTo=401PgchTPr4E&line=2&uniqifier=1)`

4.1 PACE: Plan

Consider the questions in your PACE Strategy Document and those below to craft your response:

4.1.1 Task 1. Understand the situation

- How can you best prepare to understand and organize the provided information?

Begin by exploring your dataset and consider reviewing the Data Dictionary.

==> ENTER YOUR RESPONSE HERE

4.2 PACE: Analyze

Consider the questions in your PACE Strategy Document to reflect on the Analyze stage.

4.2.1 Task 2a. Imports and data loading

Start by importing the packages that you will need to load and explore the dataset. Make sure to use the following import statements: * `import pandas as pd`

- `import numpy as np`

[2]:
```
# Import packages
import pandas as pd
import numpy as np
```

Then, load the dataset into a dataframe. Creating a dataframe will help you conduct data manipulation, exploratory data analysis (EDA), and statistical activities.

Note: As shown in this cell, the dataset has been automatically loaded in for you. You do not need to download the .csv file, or provide more code, in order to access the dataset and proceed with this lab. Please continue with this activity by completing the following instructions.

[3]:
```
# Load dataset into dataframe
data = pd.read_csv("tiktok_dataset.csv")
```

4.2.2 Task 2b. Understand the data - Inspect the data

View and inspect summary information about the dataframe by **coding the following:**

1. `data.head(10)`
2. `data.info()`
3. `data.describe()`

Consider the following questions:

Question 1: When reviewing the first few rows of the dataframe, what do you observe about the data? What does each row represent?

Question 2: When reviewing the `data.info()` output, what do you notice about the different variables? Are there any null values? Are all of the variables numeric? Does anything else stand out?

Question 3: When reviewing the `data.describe()` output, what do you notice about the distributions of each variable? Are there any questionable values? Does it seem that there are outlier values?

[4]:
```
# Display and examine the first ten rows of the dataframe
### YOUR CODE HERE ###
data.head(10)
```

[4]:
```
   # claim_status    video_id  video_duration_sec  \
0  1        claim  7017666017                  59
1  2        claim  4014381136                  32
2  3        claim  9859838091                  31
3  4        claim  1866847991                  25
```

```
4   5        claim  7105231098                  19
5   6        claim  8972200955                  35
6   7        claim  4958886992                  16

Question 1: When observing the first 10 rows of the dataframe each row represents a different Tiktok video that has been published where a claim or opinion has been made.

Question 2: From looking at the info of the data we see three different datatypes. We see integers, floats (decimal values), and lastly we see a data type called an object which is different data type that I have not seen. We also do not have any null values in our dataset.

4.2.3 Task 2c. Understand the data - Investigate the variables

In this phase, you will begin to investigate the variables more closely to better understand them.

You know from the project proposal that the ultimate objective is to use machine learning to classify videos as either claims or opinions. A good first step towards understanding the data might therefore be examining the `claim_status` variable. Begin by determining how many videos there are for each different claim status.

[7]:
```
# What are the different values for claim status and how many of each are in␣
↪the data?

data['claim_status'].value_counts()
```

[7]:
```
claim      9608
opinion    9476
Name: claim_status, dtype: int64
```

Question: What do you notice about the values shown? The values of each status are very similar.

Next, examine the engagement trends associated with each different claim status.

Start by using Boolean masking to filter the data according to claim status, then calculate the mean and median view counts for each claim status.

[13]:
```
# What is the average view count of videos with "claim" status?
# the first thing we want to do is create a boolean mask to filter the data for␣
↪the claim status
mask = data['claim_status'] == 'claim'
claims = data[mask]
print("Mean view counts for claims:", claims['video_view_count'].mean())
print("Median view counts for claims:",claims['video_view_count'].median())
```

```
Mean view counts for claims: 501029.4527477102
Median view counts for claims: 501555.0
```

[14]:
```python
# What is the average view count of videos with "opinion" status?

mask_opinions = data['claim_status'] == 'opinion'
opinions = data[mask_opinions]
print("Mean view counts for opinions: ", opinions['video_view_count'].mean())
print("Median view counts for opinions: ",opinions['video_view_count'].median())
```

```
Mean view counts for opinions:  4956.43224989447
Median view counts for opinions:  4953.0
```

Question: What do you notice about the mean and media within each claim category? Answer: The mean and median within each claim status are relativily similar. However, the view counts compared to eachother are vastly different as we see the claim status of **claim** is a lot greater than that of opinion based.

Now, examine trends associated with the ban status of the author.

Use `groupby()` to calculate how many videos there are for each combination of categories of claim status and author ban status.

[17]:
```python
# Get counts for each group combination of claim status and author ban status
### YOUR CODE HERE ###
data.groupby(['claim_status','author_ban_status']).count()[['#']]
```

[17]:

claim_status	author_ban_status	#
claim	active	6566
	banned	1439
	under review	1603
opinion	active	8817
	banned	196
	under review	463

Question: What do you notice about the number of claims videos with banned authors? Why might this relationship occur?

From the above table we can see that there are many more banned authors in claim videos than there are for opinion videos. This could be due to the fact that authors who post claim videos have a stricter set of rules than those who post videos of opinion based. We do not know however if just because an author posts a claim video that they are more likely to be banned than those who post opinion based videos. What we can conclude from this is that we can gather information about banned/active authors, we cannot make assumptions about whether a particular kind of video ended up getting the author banned or not.

Continue investigating engagement levels, now focusing on `author_ban_status`.

Calculate the median video share count of each author ban status.

[23]:
```python
### YOUR CODE HERE ###
data.groupby(['author_ban_status']).agg(
{
```

```
    'video_view_count': ['median','mean'],
    'video_like_count':['median','mean'],
    'video_share_count':['median','mean']
})
```

[23]:

```
                      video_view_count                  video_like_count  \
                                median          mean              median
author_ban_status
active                          8616.0  215927.039524             2222.0

```

[22]:

```
# What's the median video share count of each author ban status?
data.groupby(['author_ban_status']).median(numeric_only =␣
 ↪True)[['video_share_count']]
```

[22]:

```
                   video_share_count
author_ban_status
active                         437.0
banned                       14468.0
under review                  9444.0
```

Question: What do you notice about the share count of banned authors, compared to that of active authors? Explore this in more depth.

Answer: I noticed that the amount of videos that banned authors have shared was far greater than those of active authors. From going more in depth with the data I noticed that banned authors were not only sharing more videos than that of active authors but also were liking more videos and viewing more videos.

Use `groupby()` to group the data by `author_ban_status`, then use `agg()` to get the count, mean, and median of each of the following columns: * `video_view_count` * `video_like_count` * `video_share_count`

Remember, the argument for the `agg()` function is a dictionary whose keys are columns. The values for each column are a list of the calculations you want to perform.

[24]:

```
### YOUR CODE HERE ###
data.groupby(['author_ban_status']).agg(
{
    'video_view_count': ['count','mean','median'],
    'video_like_count': ['count','mean','median'],
```

```
    'video_share_count': ['count','mean','median']

})
```

[24]:

```
                    video_view_count                          video_like_count  \
                               count          mean    median             count

                    median
author_ban_status
active               437.0
banned             14468.0
under review        9444.0
```

Question: What do you notice about the number of views, likes, and shares for banned authors compared to active authors?

Now, create three new columns to help better understand engagement rates: * `likes_per_view`: represents the number of likes divided by the number of views for each video * `comments_per_view`: represents the number of comments divided by the number of views for each video * `shares_per_view`: represents the number of shares divided by the number of views for each video

[28]:

```
# Create a likes_per_view column

data['likes_per_view']= data['video_like_count']/data['video_view_count']

# Create a comments_per_view column

data['comments_per_view']= data['video_comment_count']/data['video_view_count']

# Create a shares_per_view column
data['shares_per_view']= data['video_share_count']/data['video_view_count']
```

Use `groupby()` to compile the information in each of the three newly created columns for each combination of categories of claim status and author ban status, then use `agg()` to calculate the count, the mean, and the median of each group.

[30]:
```
### YOUR CODE HERE ###
data.groupby(['claim_status','author_ban_status']).agg({
    'likes_per_view': ['count','median','mean'],
    'comments_per_view': ['count','median','mean'],
    'shares_per_view': ['count','median','mean']

})
```

[30]:
```
                                likes_per_view                      \
                                         count    median      mean
claim_status author_ban_status
claim        active                       6566  0.326538  0.329542
             banned                       1439  0.358909  0.345071
             under review                 1603  0.320867  0.327997
opinion      active                       8817  0.218330  0.219744
             banned                        196  0.198483  0.206868

```

Question:

How does the data for claim videos and opinion videos compare or differ? Consider views, comments, likes, and shares.

4.3 PACE: Construct

Note: The Construct stage does not apply to this workflow. The PACE framework can be adapted to fit the specific requirements of any project.

4.4 PACE: Execute

Consider the questions in your PACE Strategy Document and those below to craft your response.

4.4.1 Given your efforts, what can you summarize for Rosie Mae Bradshaw and the TikTok data team?

Note for Learners: Your answer should address TikTok's request for a summary that covers the following points:

- What percentage of the data is comprised of claims and what percentage is comprised of opinions?
- What factors correlate with a video's claim status?
- What factors correlate with a video's engagement level?
